

Summary of Professional Experience

Dr. Driscoll, an applied anthropologist and epidemiologist, develops and evaluates evidence-based risk communication, health promotion, and disease prevention interventions. His multidisciplinary research designs seek to link population-level health data and sociocultural context to create effective public health programs. His methodological experience spans a range of techniques, including unobtrusive structured observation, semistructured and structured individual and group interviews, focus group interviews, telephone interviews, group-administered questionnaires, and mail surveys. His analytical experience includes narrative and contextual qualitative analysis, perception mapping, univariate and multivariate quantitative approaches, and the triangulation of these analyses into a cohesive final product. Dr. Driscoll has led studies assessing bioterrorism and chemical terrorism preparedness programs; informing screening and treatment decisions for chronic diseases such as diabetes, prostate cancer, and lung cancer; and preventing infectious diseases such as TB and HIV/AIDS. He has more than 10 years of experience developing and evaluating health promotion interventions and conducting community-based preference elicitation studies, environmental exposure assessments, health risk characterizations, and program evaluations.

Education

Ph.D., Applied Anthropology, University of South Florida, Tampa, FL, 1999.

M.P.H., Epidemiology, University of South Florida, Tampa, FL, 1999.

M.A., Anthropology, Wake Forest University, Winston-Salem, NC, 1994.

B.A., International Studies, George Mason University, Fairfax, VA, 1990.

- 1995 (summer) **Survey Data Collector**
Aquirre International, Arcadia, FL
- 1994 (summer) **Contract Ethnographer**
Montagnard-Dega Association, Greensboro, NC

Teaching Experience

- 2007 to 2008 **Guest Instructor: Evaluating Culturally Tailored Health Communications**
CDC/American Evaluation Association Summer Institute, Atlanta, GA
- 2005 to 2008 **Guest Instructor: Communication for Health-Related Decision Making**
University of North Carolina, Chapel Hill, NC
- 1994 to 1999 **Graduate Instructor: Field Methods, Health and Development, Introduction to Anthropology**
The University of South Florida, Tampa, FL

Selected Project Experience

Pandemic Influenza Risk Communication Formative Study (2007 to 2008)—*Overall project leader responsible for study implementation and staff oversight.* Funded by CDC's National Center for Health Marketing, this study collected formative data on population-level obstacles and facilitators to the adoption of non-pharmaceutical mitigation strategies to be advocated by CDC in the event of an influenza pandemic. The study design consisted of in-depth, community-level individual and group interviews, and town-hall hearings to discuss the interview findings and study interpretations. Study participants were members of subpopulations who may encounter cultural or environmental barriers to the adoption of protective behaviors in the event of a pandemic. The data collected were used to develop recommendations for culturally appropriate and actionable pandemic influenza risk communications.

Lung Cancer Testing Formative Study (2005 to date)—*Overall project leader responsible for study implementation and staff oversight.* Funded by CDC/DCPC, this study collected formative data on knowledge, attitudes, and behaviors regarding lung cancer testing among heavy smokers, lung cancer survivors, and clinicians. These data served as a guide to direct future research and educational efforts with the target audiences. The project team, in cooperation with clinically based partners, used a combination of qualitative research methods, including focus groups and subsequent emergent follow-up interviews, in-depth interviews, and triad interviews.

NIH Roadmap—Re-Engineering the Clinical Research Enterprise: Feasibility of Integrating and Expanding Clinical Research Networks (2004 to 2008)—*Overall project leader responsible for study implementation and staff oversight.* Funded by the National Heart, Lung and Blood Institute of the National Institutes of Health through the Duke Clinical Research Institute, this study assessed obstacles to local public health system participation in clinical research and developing and evaluating interventions to overcome those obstacles. The research team employed a case study methodology to characterize the setting and context of research and to develop and evaluate interventions in eight case and eight matched controls in the Tuberculosis Trials Consortium.

Hematologic Cancer Communications (2004 to 2008)—*Overall project leader responsible for study implementation and staff oversight.* Funded by CDC/DCPC, this study assessed extant health communication materials regarding hematologic cancers by the NCI, CDC, and other information

sources; identified gaps in the information available; developed materials to fill those information gaps; and evaluated them. The research team employed an array of current health communication theory to evaluate existing data, conducted an audience segmentation strategy, and developed and tested award-winning risk communication materials.

Promoting Informed Decision Making about Prostate Cancer Screening (2002 to 2007)—*Project co-leader responsible for study implementation and staff oversight.* This 4-year study, funded by the Centers for Disease Control and Prevention (CDC), brought together multidisciplinary groups of social scientists and physician-epidemiologists to test the effectiveness of informed decision-making tools in community settings. Researchers worked in community settings with local advisory panels to implement a multimodal intervention that recognized and worked through the community's strengths and usual modes of communicating. Dr. Driscoll developed the research design and is leading the community assessment and data collection process as well as contributed to the development and evaluation of the interventions conducted.

Understanding the Ecological Risks, Costs, and Benefits of Use Attainment (2004 to 2006)—*sociocultural preference elicitation methodologist.* Funded by EPA's Office of Communications, this study summarizes the qualitative and quantitative tools currently available to elicit community-based preferences for environmental and public health decisions. The research team collected both primary and secondary data to develop a user-friendly toolkit for use in determining and understanding community-based preference and to support community environmental decisions. The toolkit was tested in a recent workshop at EPA's Cincinnati offices, and the results of that test of concept are being incorporated in a second iteration of the toolkit. Dr. Driscoll led the development of the preference elicitation methods section of the toolkit, and moderated the workshop.

Subsistence Fishers Risk Communication (2003 to 2006)—*Overall project leader responsible for study implementation and staff oversight.* Funded by ATSDR/CDC, this study combined mental modeling, social marketing, and community capacity-building theories to develop health communication messages along with resources that build community residents' capacity to collectively explore and understand the health risks associated with consumption of locally caught fish. The cultural risk modeling approach led to measurable increases in community capacity and increased individual self- and response-efficacy toward reducing risks among residents of Native-American (Lumbee Tribe), African-American, and Latino communities.

Evaluation of the Institute of Medicine's Immunization Safety Review Committee (2003 to 2005)—*Overall project leader responsible for study implementation and staff oversight.* This study, funded by CDC/NIP, evaluated the accomplishments and impact of the Institute of Medicine's Vaccine Safety Review Committee. The research involved a truly mixed-method evaluation in which the results of key informant and group interviews are integrated with data collected from an electronic survey of stakeholders.

Evaluation of the National Diabetes Initiative (2004)—*Program evaluation methodologist.* Funded by the Robert Wood Johnson Foundation, this study evaluated the Building Community Supports for Diabetes Care Program by assessing progress in 14 demonstration projects that test and introduce quality improvements in supports for diabetes self-management among high-risk populations in community settings. The research team employed a combination of qualitative interviews and rapid assessment procedures. Dr. Driscoll developed the interview and structured observation protocols and coordinated their use in community settings.

Assessing Laboratory Preparedness for Chemical Attack (2002 to 2004)—*Overall project leader responsible for study implementation and staff oversight.* This project for the Association of Public Health Laboratories (APHL) facilitated the development of a consensus definition of the analytic capabilities,

capacities, and resources required for public health laboratories to be prepared for chemical terrorist attacks. Leading the assessment of the complex array of local, state, and federal stakeholders involved in recognizing and responding to a chemical attack, how these partnerships differ across states and regions, and implementing a participatory strategy involving these stakeholders to develop a consensus definition as to what public health laboratories need to fulfill their role in the event of such an attack.

Response to Cancer Clusters with Suspected Environmental Etiology: State and Federal Capacity Building (2002 to 2003)—*Program evaluation methodologist*. This project supported CDC's Health Studies Branch in investigating the relationship between environmental exposures and cancer. The study collected, aggregated, and evaluated the cancer cluster investigation plans of each state. Dr. Driscoll developed the data collection protocols, contributed to the final report, and moderated a consensus-building workshop held at CDC facilities in Atlanta attended by the state cancer cluster coordinators.

Evaluating Academic/CBO Collaborations for HIV Prevention (2001 to 2002)—*Program evaluation methodologist*. This project for CDC/NCID evaluated the relative effectiveness of seven academic/community-based collaborations working to prevent HIV/AIDS. Dr. Driscoll developed and coordinated the case study design combining data from semistructured individual interviews and structured observations to provide an in-depth analysis of the social and environmental factors shaping each collaboration.

Medicare Screening Messages (2000 to 2002)—*Overall project leader responsible for study implementation and staff oversight*. Awarded as part of an interagency agreement between the Health Care Financing Administration (HCFA) and the Agency for Healthcare Research and Quality (AHRQ), this project managed the development of separate awareness messages regarding prostate-specific antigen screening for Medicare beneficiaries and for health care providers. In addition to developing the outreach messages, Dr. Driscoll conducted group and individual interviews to test the messages for understandability, acceptability, and content by both Medicare beneficiaries and health care providers.

Core Capacities of Infectious Disease Labs (2000 to 2002)—*Overall project leader responsible for study implementation and staff oversight*. This CDC-sponsored project was intended to facilitate the development of a consensus definition of core capacities and capabilities for the identification and characterization of, and response to, emerging infectious diseases. Project methods included telephone interviews with a representative sample of state public health officers, focus group interviews with state laboratorians, and in-depth individual interviews with federal stakeholders to develop and implement a consensus-building workshop in Atlanta. Dr. Driscoll authored the summary and recommendations report, describing particularly how the consensus-building process was applicable to the evaluation and refinement of other complex surveillance systems, including for bioterrorist attacks.

An Assessment of the Internet-Enhanced Concept Evaluation Panel (CEP) Demonstration Project (2000 to 2001)—*Program evaluation methodologist*. The National Cancer Institute (NCI) implemented a demonstration project to introduce external peer review of proposed Phase III clinical trial concepts. Dr. Driscoll developed and conducted focus group interviews to assess perceptions among participants in the genitourinary and lung cancer concept evaluation panels to determine how the CEP format was working and how it might be improved. The qualitative data were then used to develop, implement, and analyze a structured quantitative survey of NCI staff and Cooperative Groups nationwide.

Public Education Campaign Evaluation (2000 to 2001)—*Overall project leader responsible for study implementation and staff oversight*. Working as the Evaluation and Applied Research Coordinating Center for the American Legacy Foundation, RTI evaluated the efficacy of various antitobacco initiatives funded through the national tobacco settlement. This study assessed the efficacy of the Truth Tour, a social marketing campaign using youth as spokespersons in three traveling caravans. Dr. Driscoll developed and implemented an innovative research design combining real-time ethnographic and survey

data to provide a rich assessment of the tour from the perspective of local youth even as the tour took place.

Eastward Ho!/Brownfields Redevelopment Project (1997 to 1999)—Overall project leader responsible for study implementation and staff oversight. Funded by the Society for Applied Anthropology (SfAA) and EPA, this study demonstrated the utility of ethnographic and social marketing techniques for preference elicitation and participatory environmental risk decision-making for redeveloping urban brownfields in Miami, Florida. The study involved the implementation of rapid assessment procedures for collecting and analyzing data on sentinel health events, perceptions of health risk, and site-use patterns among the residents of several ethnically diverse neighborhoods bordering lightly contaminated sites. A GIS database of medical, ethnographic, and demographic data was made available to federal, state, and local governmental agencies for characterizing and managing environmental health risks on these sites.

Honors

Environmental Anthropology Consultancy, Society for Applied Anthropology/Environmental Protection Agency, 1998
Environmental Anthropology Fellowship, Society for Applied Anthropology/Environmental Protection Agency, 1997
Graduate Fellowships, Department of Anthropology, University of South Florida, 1994-1999
University Foundation Grant, University of South Florida, 1994
Prize-winning entry in the SAS Graduate Student Paper Competition, 1994, “We Are Dega: Ethnic Identity Manipulation in a Population of Southeast Asian Refugees.” Presented at the Southern Anthropological Society Conference, Raleigh, NC
